7 **Abstract**
8

9 Objects hung with the improved hook & cord loop hanging system uses
10 one or more adjustable hooks for changing the length of one or more
11 flexible cord loops. This hanging system is an improvement over the
12 hangers described in patent 5,947,438. Each improved hanger can either
13 be affixed to the object or to the surface the object is being hung on. The
14 cord loop or loops interface with various supports connecting to or affixed
15 to the object or to the surface when the hanger is on the object. The single
16 hook and single cord configuration provides vertical adjustability by
17 shortening the length of the cord through the turning of the screw the
18 adjustable hook is riding on. A single hook and double cord
19 configuration provides support and locking for the object. A double hook
20 and double cord configuration provides vertical adjustability and locking
21 capability. These hangers can be used alone for small objects or in pairs for
22 larger or heavier objects.
